Installing FaroAI — Step-by-Step

A no-jargon walkthrough from “open your web browser” to “use the app”. About 15-20 minutes the first time. After that, double-click an icon and you're in.

If a step doesn't work, jump to **Troubleshooting** at the bottom.

What you'll need before starting

- A computer running macOS or Windows.
- An internet connection.
- An **Anthropic account** — free, you'll create one in Step 4 if you don't already have one. No credit card required.
- A **Chartmetric refresh token** — you already have this. Keep it handy in a notes app; you'll paste it in the very last step.

That's it. No paid subscriptions, no developer tools.

Step 1 — Download FaroAI from GitHub

1. Open your web browser (Safari, Chrome, Edge — any works).
2. Go to: <https://github.com/TomerWeissman/farolatino/releases/latest>

3. The page will be titled with a version number, e.g. “v0.1.0”. Scroll down to the **Assets** section.
4. Click **farolatino-v0.1.0.zip** to download it.
5. Find the file in your **Downloads** folder.
 - **Mac**: open Finder -> Downloads.
 - **Windows**: open File Explorer -> Downloads.
6. Double-click the .zip to unzip it. You’ll get a folder named farolatino-v0.1.0.
7. Move that folder somewhere you can find again — your **Documents** folder is a good choice.

If the Releases page doesn’t show a .zip file, message Tomer — a release may not have been published yet.

Step 2 — Install Python

Python is the language FaroAI runs on. Install it once, forget it exists.

1. Go to <https://www.python.org/downloads/>
2. Click the big yellow **Download Python 3.x** button (anything 3.11 or higher works).
3. Open the downloaded installer.

On Mac

- Double-click the installer and click **Continue** through every screen, then **Install**.

On Windows

- **IMPORTANT**: on the very first screen of the installer, check the box that says **Add Python to PATH** before clicking Install. If you forget, run the installer again and tick it.

Check it worked

You’ll need to open Terminal (Mac) or PowerShell (Windows). If you’ve never done this:

- **Mac**: press Cmd + Space, type Terminal, press Enter. A small black window appears.
- **Windows**: press the Windows key, type PowerShell, press Enter. A blue window appears.

In that window, type this exactly and press Enter:

```
python3 --version
```

(On Windows, type python --version instead.)

You should see something like Python 3.11.5. If you get “command not found”:

- **Mac**: close Terminal, reopen it, try again.
- **Windows**: re-run the Python installer and tick **Add Python to PATH**.

You can close the Terminal/PowerShell window after this check.

Step 3 — Install Node.js

FaroAI uses Claude Code as its AI engine, and Claude Code needs Node.js. Same drill — install once and forget it.

1. Go to <https://nodejs.org/>
2. Click the big green **LTS** download button on the left.
3. Open the installer and click **Continue** / **Next** through every screen — don't change any defaults.

To verify, open Terminal/PowerShell again (close any old window first so it picks up the new install) and type:

```
node --version
```

You should see v20.x.x or similar.

Step 4 — Install Claude Code

Claude Code is the AI engine FaroAI uses to answer questions.

1. Go to <https://claude.com/claude-code>
2. Follow the install steps on that page. Usually it's a single command you paste into Terminal/PowerShell.
3. Once it finishes, in the same Terminal/PowerShell window, type:
`claude login`
4. Your web browser will open. Sign in with an **Anthropic account**. If you don't have one, click **Sign up** — it's free, no credit card.
5. Approve the permissions Claude Code requests.
6. Go back to Terminal — it should say something like "Logged in".

You only do this **once**. Future FaroAI launches don't need it.

Step 5 — Launch FaroAI

The setup is done. Now to actually start the app:

On Mac

1. Open Finder and navigate to the `farolatino-v0.1.0` folder.
2. Find the file called `start.command`.
3. **Right-click** it and choose **Open**. (On a trackpad, "right-click" means a two-finger tap, or hold the `Control` key while clicking.)
4. macOS will ask "Are you sure you want to open it?" — click **Open**.

The right-click is only needed the very first time. After that, you can double-click normally.

On Windows

1. Open File Explorer and navigate to the `farolatino-v0.1.0` folder.
2. Find the file called `start.bat`.
3. **Double-click** it.
4. Windows SmartScreen may say “Windows protected your PC” — click **More info** -> **Run anyway**.

What happens next

A Terminal window opens and shows progress messages. The first launch takes about **60 seconds** while it sets things up; subsequent launches take ~5 seconds.

When ready, your web browser opens automatically to the FaroAI dashboard. **Don't close the Terminal window** — closing it shuts the app down. Just minimize it and forget about it.

Step 6 — Paste your Chartmetric token (in the app)

The dashboard is open. Last step:

1. In the left sidebar, click **Connections**.
2. You'll see rows for Chartmetric, Spotify, YouTube. Click the **Chartmetric** row to expand it.
3. Paste your Chartmetric refresh token into the text box.
4. Click **Save**. The status indicator on that row should turn green and say “ok”.
5. Click **FaroAI** at the top of the sidebar to return to the chat.

That's it. Try typing `@evaluate Bad Bunny` to see a full artist dossier.

Day-to-day use

- **Start FaroAI:** double-click `start.command` (Mac) or `start.bat` (Windows). Browser opens automatically. Takes ~5 seconds.
 - **Stop FaroAI:** close the Terminal window. Your browser tab can stay open — it'll just show a connection error until you relaunch.
 - **Update FaroAI:** when a new release comes out, download the new `.zip` from GitHub the same way as Step 1, unzip it, and replace your old folder. Your Chartmetric token lives in a hidden file inside the folder; the easiest way to keep it is to re-paste it in the Connections page after updating.
-

Troubleshooting

What you see	What it means	What to do
Terminal/PowerShell closes the moment it opens	Something's missing — usually Python or Claude Code	Re-launch <code>start.command</code> / <code>start.bat</code> , watch the window for the actual error message

What you see	What it means	What to do
Window says “Python isn’t installed”	Step 2 didn’t take	Re-do Step 2; on Windows make sure Add Python to PATH is ticked
Window says “Claude Code isn’t installed”	Step 4 didn’t take	Re-do Steps 3 and 4
claude: command not found when running claude login	Either Node.js or Claude Code isn’t on your PATH	Restart Terminal/PowerShell, retry. If still failing, redo Steps 3 and 4
Browser shows “This site can’t be reached”	The launcher is still booting	Wait 5 seconds, refresh the browser tab
“Address already in use”	A previous FaroAI is still running	Quit its Terminal window, relaunch
Chat says “Backend closed the stream...”	Connection to the launcher dropped	Quit Terminal, relaunch
Connections page shows Chartmetric as red	Token is wrong or expired	Re-paste it; if still red, the token has been rotated — ask Tomer for a new one

Still stuck? Take a screenshot of the Terminal window (the error message is shown verbatim there) and send it to Tomer. That’s almost always enough to debug remotely.

- **Screenshot on Mac:** Cmd + Shift + 4, drag a box around the Terminal window. The image saves to your Desktop.
- **Screenshot on Windows:** press PrtScn (or Win + Shift + S for a selection box), then paste into a chat or email.

What you can safely ignore

- The hidden **.env** file inside the FaroAI folder. The Connections page in the app handles everything inside it for you.
- The other subfolders (api, core, web, ...) — those are the app’s source code. Don’t move or rename them.

Welcome to FaroAI.
